about Fish

AN Italian global company leader in the world of aquariums and ponds for more than forty years.

Mr Zanon Ferruccio, founder of the company, was one of Italy's pioneers in the field of fishkeeping since the 1970s. In 1976 **PRODAC** was founded (the name stands for "prodotti d'acquario", aquarium products) with the idea of using their passion and experience at the service of fish keepers in search of quality and competence.

Since the 1970s, the company began producing water treatments, filter media, test kits and 99.9% pure salt for marine aquariums, fish food and many other items. In the 2000s, following the family tradition, the sons Mauro and Giovanni joined the management team, bringing with them new skills and energy.

During this period PRO.D.AC. began its expansion and started exporting all over the world, effectively becoming an "International" company. Strict selection of the best raw materials, proper combination thanks to a careful analysis by our Research and

Development team, full management of the production process, allow PRO.D.AC. to provide the market with top-quality products, all the while restricting production costs. Our products are appreciated all over the world for their excellent quality/price ratio.

Today, PRODAC INTERNATIONAL exports to more than 50 countries in 5 continents.

OUR VALUES

The thing our clients hold dear more than anything else is the well-being of their fish.

PRODAC guarantees their well-being at a fair price, respecting the environment.

For this reason, our guiding values are:

- *the well-being of the fish;*
- *respect for the environment;*
- *products made in Italy*

ENVIRONMENTAL SUSTAINABILITY

PRODAC regulates its own strategic choices according to environmental criteria and to a vision that is linked to the planet's environmental development. Our sensitivity regarding environmental issues has led us to be the world's first company in our field to create packaging for our food made of biodegradable plastic, reducing environmental impact.

IDENTITY INTERNATIONALLY ACKNOWLEDGED

Thanks to the professionalism of our proposals and the known quality of our Italian-made products, today **PRODAC INTERNATIONAL** is a globally recognized brand, exported worldwide through a network of specialized distributors and retailers.

INDUSTRIAL PRODUCTION, SMALL-SCALE QUALITY

The quality of our products is personally guaranteed by the Zanon family, now in its second generation in the business and always involved first-hand in the management of the company, capable of creating an efficient industrial production with the artisan quality and craft that only a fishkeeper can guarantee.

WELL-BEING BEGINS WITH FOOD

PRODAC works side by side with technologists, veterinarians and biologists to define the most balanced and nourishing contents for the food it produces. Its wide range of fish food can meet any specific need, always ensuring healthy, complete and digestible meals.

WIDE RANGE OF PRODUCTS FOR SPECIFIC REQUIREMENTS

The best results in terms of fish well-being, health and longevity can be obtained with specific products for different types, families and sizes of fish. This is why **PRODAC** has studied a wide range of foods, water tests and water treatment systems, filtration materials and many other products, to ensure the proper functioning of your ornamental fish tank.

Filtering Media

*The heart of the aquarium is the filter.
The right choice of filter materials is the basis for a good
functioning of the aquarium.*

CRYSTALCIL MINI

Sintered glass cylinder media with an excellent porosity for mechanical and biological filtering of fresh and saltwater aquariums. CRYSTALCIL MINI has a dual function: mechanical filtering as it traps coarse impurities carried by the water (leaves, excess food, excrement), biological filtering thanks to its porous characteristic which offers a large surface area to help and promote bacteria development which then break down the organic substances.

For 
from 80 to 120 liters

Average size of the cylinder: H 1,1 cm x Ø 1,1 cm

- **Use:** Place CRYSTALCIL MINI in the external filter or in the biological filter under the water recycle pump so that the water passes through it completely. Our 200 gr packet is sufficient for 80-120 litre aquariums. Although this product remains effective for a long period of time, it is however recommended to replace approximately every six months.

CARBOZEO

Filtering medium blend made with 50% super-activated carbon (CLAROCAR) and 50% best selected zeolite (ZEOLITE) for fresh and marine water aquarium. Activated carbon absorbs the polluting pigments produced by the decomposition of many substances in aquarium, such as food waste, dead algae and plants. Zeolite absorbs and neutralizes nitrites, nitrates, silicates and ammonia, keeping the aquarium water crystal clear. On the basis of very positive tests made at their own laboratories, PRODAC guarantee excellent results by using CARBO ZEO as filtering medium.

For  from 100 to 150 liters

• **Use:** Fill a fine mesh bag with the media, place it in the external filter or in the biological filter located under the centrifugal pump so that water passes through it completely. Packet of 700 gr sufficient for 120 to 150 l aquarium. The product must be replaced every 90 days.

ZE700		700 g	12 PCS	8 018189 100369

MUTACAL

This product consists of special ion exchange resins which reduce the total water hardness in freshwater aquariums. The ideal total hardness for freshwater aquariums are between 4-8 dGH. German degrees of hardness (approximately 14 °fGH – French degrees of hardness), whereas total water hardness GH of tap water is on average 11 °dGH - German degrees of hardness and often higher. MUTACAL resins activate an ionic exchange process which is the exchange of the ions in the water with other ions attached to the resins. This process lowers the water hardness in the aquarium to a safe level for the fish.

ESSENTIAL FOR DISCUS BREEDING

Net Bag Included

• **Use:** The packet contains 250 ml of resins which is sufficient for 130 litres of water. Depending on aquarium capacity, fill a fine mesh bag with the required quantity of MUTACAL resins and place it in a suitable position so that the water passes through it. After 24 hours test water hardness (for ex. use PRODAC'S water test PRODACTEST GH) if hardness results to be at an acceptable level, remove the bag containing the resins. If total hardness is still too high, replace the bag in the aquarium after having first regenerated the resins. To regenerate the resins proceed as follows: dissolve 500 gr of salt in two litres of water, place the fine mesh bag containing the resins in a funnel or similar container and pour the saltwater solution over the bag, collect the water in a container and reusing the water collected repeat this operation for about ten minutes. Once these resins have been regenerated, reposition in the aquarium as previously described. Caution: do not remove the resins from the mesh bag and for future use maintain them moist. If these resins dry out, they become ineffective and cannot be reutilised. MUTACAL resins can be regenerated up to three times.

MCAL	250 ml	12 PCS	8 018189 100192

NO NITRATES

A filtering media consisting of specific resins which adsorb nitrates found in freshwater aquariums and do not release the adsorbed substances in the water. It is recommended that nitrates concentration is maintained below 50 mg/l to prevent creating the ideal conditions for algae growth.

Net Bag Included

• **Use:** Fill the fine mesh bag provided with the product, rinse under running water for approximately 3 minutes and position in the biological filter preferably located underneath the recycle pump so that the water passes through it completely or position the bag with the product in the external filter. Dosage: 100 ml is sufficient for 400 litres of water. When to replace this product depends on the quality of nitrates in the water, however it is recommended to replace every six months. There are no adverse effects in the event the recommended dosage is exceeded. The packaging contains 2 bags x 100 ml of product.

ITEM CODE	SIZE	CARTON	BARCODE
NON200	200 ml 	12 PCS	 8 018189 100314

NO PHOSPHATES

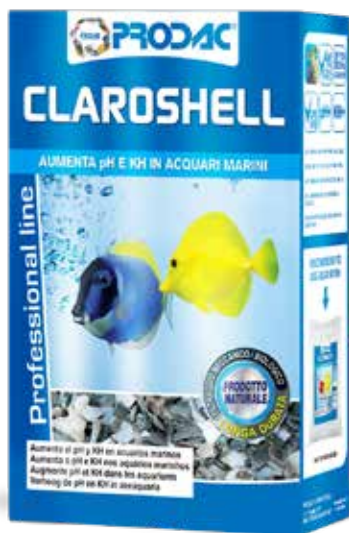

A filtering media consisting of specific resins which adsorb phosphates and silicates found in fresh and saltwater aquariums and do not release the adsorbed substances in the water. It is recommended that phosphate concentration in freshwater aquariums does not exceed 0.3 mg/l as this promotes the ideal conditions for algae growth, whereas in saltwater aquariums it is highly recommended that the phosphate concentration does not exceed 0.1 mg/l otherwise this condition affects the natural process of calcium absorption by organisms in the aquarium which require this vital substance such as red coralline algae, hard corals.

Net Bag Included

• **Use:** Fill a fine mesh bag with the product, rinse under running water for approximately 3 minutes and position in the biological filter preferably located underneath the recirculation pump so that the water passes through it completely or position the bag with the product in the external filter. NO PHOSPHATES can be also placed in a fluidised bed filter in saltwater aquariums fitted with this system, in this way the product is continuously moved by the constant water flow. Dosage: 200 ml of product is sufficient for 800 litre freshwater aquariums and 400 litre saltwater aquariums, 100 ml of product is sufficient for 400 litre freshwater aquariums and 225 litre saltwater aquariums. When to replace this filter media depends on the quantity of phosphates and silicates in the water, however it is recommended to replace with new media every four months. There are no adverse effects in the event the recommended dosage is exceeded.

NOP200	200 ml 	12 PCS	 8 018189 100093

CLAROSHELL

Natural filtering material consisting of small marine shells, suitable for use in a marine aquarium filter as it keeps the alkaline pH value (buffer effect) stable, maintaining it at an optimal level for the health of the fish. A product highly effective for mechanical and biological filtering especially if it is used together with PRODAC FILTERWATTE and PRODAC CLAROCAR. It can be used in a calcium reactor to guarantee the necessary calcium supply to SPS and LPS corals due to their construction.

NATURAL PRODUCT Increase Calcium Levels

For 
from 150 to 200 liters

- **Use:** Fill a fine mesh bag with this product and then place the bag in the biological filter.
Packet of 1000 gr sufficient for 150 to 200 l aquarium. The product must be replaced every 90 days.

BIOCLARO

Filter sponge, fine porosity and coarse porosity, for biological and/or mechanical filtration in fresh and marine water aquarium and pond.

CRYSTAL WATER

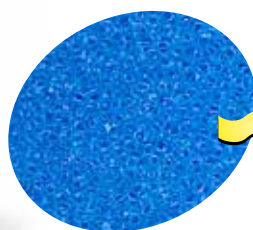

- **Use:** Rinse before using. Insert the black sponge in the water inlet of the filter, to hold larger particles. Insert the blue sponge in the intermediate stage of the filter. Both sponges must adhere the filter walls. Water must go through the sponges. Rinse the sponges every 3 months using only tap water and replace them every 12 months. We advise washing one sponge at a time, waiting 7 days before washing the other one, to avoid destroying the bacterial fauna.

Water Treatment

Like in the oceans, rivers and lakes, even in the aquarium water is the element that determines the survival of every organism that lives in it.

In the breeding of any aquatic organism, the quality and chemical-physical characteristics of water are the most important.

AQUASANA

A water conditioner for fresh and salt water aquariums, necessary to neutralize the chlorine and chloramines from tap water, to reduce the heavy metal polluting effects of chemicals in the tap water and to prepare it for your fish. It is enhanced with ALOE VERA, a special natural colloid which protects the surface and gills of fish. ALOE VERA has the ability to heal wound and promote regeneration of damaged fish tissue.

AQUASANA must be used immediately after filling your new aquarium and when water is partially replaced as it maintains the pH level stable and it is ideal and efficient to reduce fish stress.

30 ml = 120 lts
100 ml = 5.000 lts
250 ml = 12.500 lts
500 ml = 25.000 lts
5000 ml = 250.000 lts

- Use 100-250-500-5000 ml: add 5 ml to every 250 litres of water.
- Use 30 ml: add 1 drop of AQUASANA per litre at any water change.

NITRIDAC

A liquid high concentration of bacteria carefully selected for their capacity in breaking down organic matter and for transforming ammonia in aquariums. This product can be used in new or existing fresh and saltwater aquariums to transform highly toxic ammonia into nitrites and nitrites into nitrates. NITRIDAC actually causes the rapid degeneration of organic compounds reducing the build up of sediment or mud, restores aquarium walls and beds preventing the formation and growth of algae and also prevents an increase in nitrites.

30 ml = 300 lts
100 ml = 1.000 lts
250 ml = 2.500 lts
500 ml = 5.000 lts
5000 ml = 50.000 lts

- **Use 100-250-500-5000 ml:** shake well before use, 5 ml for every 50 litres of water once a day for 7 days; for ongoing treatment same dose once a month. The ideal conditions for optimal bacteria growth are: water temperature min. 5°C and max 45°C, pH level between 6 and 8.5.
- **Use 30 ml:** and dosage: shake well before use, 2,5 ml = 50 drops for every 25 litres of water once a day for 7 days; for ongoing treatment same dose once a month.

ALGA CONTROL

Is a water treatment for freshwater aquariums which controls, prevents and eliminates the growth of algae and infusoria that is harmful to fish, and above all to aquatic plants. Green algae, not only grows on the bottom of the aquarium and on the decorations, but it can also develop on the foliage of aquatic plants impeding their growth.

100 ml = 500 lts
250 ml = 1.250 lts

• **Use:** depending on the extent of opaqueness and colour of the water, once a week add 10 ml every 50 litres of water. To prevent the growth of algae and infusoria, as well as using ALGA CONTROL it is recommended to: make sure the aquarium is not in direct sunlight, do not overfeed, control water acidity (pH) and adjust lighting and use appropriate light bulbs for aquariums.

MUTAPHI D pH-/KH-

The ideal pH value in a freshwater aquarium is between 6,5 and 7,0 depending on the species of fish. An increase or a decrease in this value can be very dangerous for the fish and above all when the it exceeds 7,5. MUTAPHI D pH-/KH- is a liquid solution which lowers the pH level to the required value.

• **Use:** control the pH level of the water with PRODACTEST pH and if it results to be higher than the values given, pour 3 ml of MUTAPHI D pH-/KH- for every 20 lt of water directly into the aquarium. After about 2 hours recontrol the pH value. If the pH level has not dropped to the required value, add a further dosage of 3 ml of MUTAPHI D pH-/KH- for every 20 lt and recontrol the pH after 2 hours. Repeat this procedure until obtaining the required pH level. Caution: it is of utmost importance to gradually and slowly return the pH level to its correct value, abrupt changes in pH are harmful to the fish.

DISCUS ELIXIR

Is a concentrate solution formulated for Discus and all other freshwater tropical fish. It contains iodine, magnesium and a complete vitamin B complex (B1, B2, B6) ideal for increasing vitality, stimulating appetite and reproduction and promoting the fish's natural colour. As aquarium water poor in iodine provokes thyroid problems and magnesium strengthens and reinforces the bone structure preventing stunted growth, it is therefore essential to maintain these minerals at a constant level in the aquarium. As DISCUS ELIXIR is a liquid it is easily absorbed and constant use of this product ensures these minerals and other elements vital for Discus and all other tropical fish are maintained in the water.

- Use: every four weeks pour 10 ml for every 20 litres of water directly into the aquarium.

250 ml = 500 lts
500 ml = 1.000 lts

Water Test

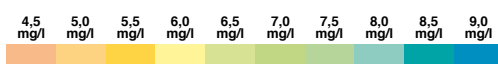

THE IMPORTANCE OF CHECKING WATER

Checking the water chemical values
is an indispensable operation for every
aquarium keeper.

Reliable, Accurate · Easy to use
COLOUR SCALE

TEST pH 4,5-9,0

Water test for measuring the pH.

1. Rinse the water sample test tube several times with the water to be tested and then fill with sample water to the 5 ml mark.
2. Add 2 drops of the reagent contained in the bottle and gently swirl to mix.
3. Match the colour of the sample with the colour chart by positioning the test tube next to the most similar colour. For accurate readings compare the colours from above.

The ideal pH level for freshwater fish is between 6.8 and 7.0, if lower, it is necessary to increase the pH to a safe level for the fish. To do this utilize a specific product such as PRODAC'S MUTAPHI "M" pH+/KH+. If the pH level is higher, it is necessary to lower it and to do this use a specific product such as PRODAC'S MUTAPHI "D" pH-/KH-. The ideal pH level for saltwater is between 8.1 and 8.4, if lower, it is necessary to increase the pH to a safe level for the fish. To do this utilize a specific product such as PRODAC'S MUTAPHI "M" pH+/KH+. If the pH level is higher, it is necessary to lower it and to do this use a specific product such as PRODAC'S MUTAPHI "D" pH-/KH-.

1. Rinse the water sample test tube several times with the water to be tested and then fill with sample water to the 5 ml mark.
2. Add 8 drops of reagent n. 1 gently swirl to mix.
3. Add a very small amount of test reagent 2, just the tip of the spatula, the solution turns a pink-violet colour.
4. Add one drop at a time of reagent n. 3. and gently swirl to mix the solution after every drop. COUNT the number of drops until the solution turns from a pink-violet colour to light blue.
5. Once the solution has turned light blue leave it to stand for 30 seconds. If the colour disappears, add more drops of reagent 3 until the solution remains this light blue colour.

6. To calculate the quantity of calcium in mg/l contained in the water multiply the number of drops of reagent n.3 utilized to turn the solution a light blue colour by 20. CAUTION: it is of utmost importance that the drops of reagent n.3 are regular in size, if scarce or excessive it is recommended to repeat the test.

SPEEDY TEST

Strip-test to measure: KH, pH, Cl₂, GH, NO₂, NO₃ e CO₂

The easy, fast and accurate test to measure KH, pH, Cl₂, GH, NO₂, NO₃ and CO₂ present in the water of a fresh-water aquarium, in marine water or in garden pond water.

We recommend that you perform this test in natural daylight and not in an environment illuminated with artificial lighting.

CAUTION - The strip test is sensitive to humidity. Open the container, take out the strips that are required and close the container immediately.

Instructions for use: Dip a SPEEDY TEST strip into the water of an aquarium or into pond water. Shake it for one or two seconds in the water. Remove the strip from the water.

Shake off any excess water from the strip. Rest the strip on the container as shown in fig. 1. The Cl₂ value must be immediately compared. Read the result at the point where the colour of the strip best matches the colour on the chromatic scale. Wait 60 seconds.

Compare the colours of the other tests with those on the chromatic scale. Read the result at the point where the colour of the strip best matches the colour on the chromatic scale.

Measurement of the CO₂ value will occur by means of the table, cross-checking the pH and KH values. The recommended CO₂ values are highlighted in grey.

SPEEDY TEST

LABORET

For measuring their levels in fresh water aquarium.
4 TESTS: KH, pH, GH, NO₂.

Water test set including 4 tests:

- Water test for measuring nitrites NO₂
- Water test for measuring total hardness GH
- Water test for measuring temporary hardness KH
- Water test for measuring the pH

This practical pack is particularly suitable for people who buy their first aquarium and have to get familiar with the control of the most important values in aquarium water.

Products for plants

PLANTS ARE THE AQUARIUM LUNG

Plants are a very important element for a good functioning of the aquarium, as they carry out several vital functions.

HUMUS

Fertilizing substrate soil consisting of several types of peat.

- **Use:** cover the bottom of the aquarium with a 1.5 cm deep layer of HUMUS, avoid packing it down and then cover with a 6-7 cm deep layer of gravel. This product maintains its efficiency for a long period of time (approximately 2 years) and should be replaced at each new aquarium set up.

ITEM CODE	SIZE	WEIGHT	CARTON	BARCODE
HUMUS		500 g	12 PCS	 8 018189 300042

HUMUPLUS

Bottom soil ideal for aquatic plants consisting of several types of clay. It is the perfect product in particular for all types of Cryptocoryne, Heteranthera zosterifolia (star grass), Aponogeton madagascariensis (Madagascar lace-leaf), Aponogeton ulvaceus, Echinodorus tenellus (Pygmy chain sword). HUMUPLUS helps to lower the pH value and Redox potential of the water allowing greater activity of the fertilizing properties which are then easily assimilated by the plants.

**WITH
MINERAL
SUBSTANCES**

- **Use:** cover the bottom of the aquarium with a 1.5 cm deep layer of HUMUPLUS, avoid packing it down and then cover with a 6-7 cm deep layer of gravel. This product maintains its efficiency for a long period of time (approximately 2 years) and should be replaced at each new aquarium set up.

FERTIL PEAT PLATE

Substrate for freshwater aquariums. FERTIL PEAT PLATE is a natural material that promotes the development of aquatic plants, maintains the acid pH and counteracts the formation of algae. Ideal in Aquascaping for the formation of terraces, hills and mountainous landscapes.

on top of FERTIL PEAT PLATE (such as PRODAC'S FERTILPLANT). Insert the plants until their roots touch the tablets to allow them to easily take root. ATTENTION: to prevent FERTIL PEAT PLATE from rising to the surface during water introduction, immerse the tablets in water for at least 24 hours before using them in the aquarium.

• **Use:** cover the bottom of the aquarium completely with peat tablets or cover only the desired part where the plants will be placed. Spread an 8-10 cm layer of gravel or substrate

NUTRON CO2

Carbon dioxide is an essential element for plants and in particular for their structure.

In an aquarium environment carbon dioxide is in part produced by the fish, which however is an insufficient quantity for the plants, and more specifically for the foliage or « greenery » which is normally a predominate feature in an ornamental aquarium.

These effervescent NUTRON CO2 tablets not only release carbon dioxide in the water, but other nutritional substances for stimulating a lush plant growth, an important advantage over the use of CO2 bottles which only release carbon dioxide. These NUTRON CO2 tablets are quick dissolving (approx. 10-15 sec.) and do not leave traces of excipients substances contained in the tablets act as the reaction medium and are absorbed rapidly by the plants.

• **Use:** one tablet for every 50 lt of water, once a week. Simply drop the tablet in the middle of the aquarium. If more tablets are required, drop them in different points in the aquarium allowing a uniform release of carbon dioxide in the water. Up to a 40% over dosage is tolerated and does not harm the fish.

AND OTHER
NUTRIENTS**

Marine Salt of first quality

We are pioneer in sea salt production since 1983

SEA SALT is produced at our facility and has a level of purity near to 100%.

Each grams of sea salt contains the same mix of trace elements found in sea water which are essential for the survival of marine organisms.

OCEAN FISH

Is very quick dissolving marine salt for ornamental aquariums with a grade of purity of almost 100%. The salt contains all the necessary trace elements for ensuring a correct fish and invertebrates growth. These trace elements remain unaltered when the salts dissolve.

• **Use:** Dissolve the required quantity of salt in fresh water at a temperature of 24°C. The ratio is 33 gr per 1 litre of water, mix well and if possible utilize osmotic water. This solution can be prepared either in non-toxic plastic containers or directly in the aquarium. If utilizing directly in the aquarium, we recommend that you start up the centrifugal pump to obtain an optimum mix. It is recommended to always control the density of salt water, if it is lower than 1025 add OCEAN FISH until obtaining the required level, if the density is over 1025 add fresh water. This salt solution can be used immediately, however it is recommended to wait 12 hours before putting the fish in the aquarium. For maintaining a correct marine environment in the aquarium, it is necessary to change 25% of the water monthly and adding at each water change the indispensable trace elements for a correct biological balance (e.g. PRODAC'S MARINE TRACE ELEMENTS).

OCEAN LOBSTER

A marine salt which is perfect for breeding and stocking crayfish, lobster and any kind of crustacean for human feeding in restaurant and in fishmonger's shop. OCEAN LOBSTER salt has 8.1 pH value, it is totally fast soluble and keeps water crystal clear. It contains all the necessary trace elements for keeping crustaceans not only alive but also very safe because it re-creates the biological balance of the sea water in tank.

• **Use:** Dissolve 33 - 35 gr/l salt in osmotic water if possible. Tap water does not jeopardize the efficiency of the salt provided that water is kept still for 12 - 24 hours before use, to allow oxygenation and chlorine evaporation. It is recommended to always control the ideal water temperature 6°C - 8°C and the density of salt water, which must be 1024-1025 for crayfish and 1028 for lobster. For maintaining a correct biological balance in the tank it is recommended to change 25% of the water each two months or more frequently if the stocked quantity of crustacean is high.

AR20KG		20 Kg	1 PCS	8 018189 500176

OCEAN REEF

Is are quick dissolving marine salt specific for reef aquariums with a grade of purity just under 100%. This salt contains all the necessary trace elements for ensuring a correct fish and invertebrates growth and are further fortified with calcium and vitamins for stimulating growth and strengthening invertebrates with rigid skeleton.

• **Use:** Dissolve the required quantity of salt in fresh water at a temperature of 24°C. The ratio is 33 gr per 1 litre of water, mix well and if possible utilize osmotic water. This solution can be prepared either in non-toxic plastic containers or directly in the aquarium. If utilizing directly in the aquarium, we recommend that you start up the centrifugal pump to obtain an optimum mix. It is recommended to always control the density of salt water, if it is lower than 1025 add OCEAN REEF until obtaining the required level, if the density is over 1025 add fresh water. This salt solution can be used immediately, however it is recommended to wait 12 hours before putting the fish in the aquarium. For maintaining a correct marine environment in the aquarium, it is necessary to change 25% of the water monthly and adding at each water change the indispensable trace elements for a correct biological balance (e.g. PRODAC'S MARINE TRACE ELEMENTS).

Trace Elements

Essential for life

Trace elements stimulate the healthy and balanced growth of all aquarium animals. They stabilize biological system.

**NEW
PRODUCT**

MARINE TRACE ELEMENTS K, I, F, Mn, Mo, B, Zn, Ni, Li, Fe

Concentrated solution of trace elements, containing potassium, iodine, fluorine, manganese, molybdenum, boron, zinc, nickel, lithium and iron.

MARINE TRACE ELEMENTS guarantees an optimal development, growth and coloration (pink, red, green / yellow, purple / blue) of LPS, SPS and soft corals. Iodine in soft corals helps protect the mucus and promotes the development of the pink colour, it is also essential for the correct metabolism of fish, corals and crustaceans; iron promotes green / yellow colour; boron promotes red, pink and purple colouring; manganese favours blue and red colour.

- Use: shake the bottle well before use. Pour 5 ml every 100 L of water directly into the aquarium on average once a week. Increase the frequency of administration (every 4-5 days) in the case of an aquarium containing numerous invertebrates.

PRODUCT**

REEF CALCIUM

Concentrated solution of pure calcium for reef aquariums and for all marine aquariums with invertebrates, especially studied to compensate sudden drops and calcium deficiencies. Calcium is one of the basic element for the formation of the endoskeletons of hard corals such as LPS and SPS. The addition of REEF CALCIUM helps to maintain the optimal calcium value between 400-500 mg / l. The skeleton of corals, algae, molluscs and many invertebrates is largely made up of calcium and magnesium carbonates. In aquariums with many corals and invertebrates, the calcium level can easily change, which is why REEF CALCIUM allows you to maintain adequate levels of calcium in the aquarium. REEF CALCIUM provides a rich source of metabolic energy to help coral growth at times of greatest demand during growth, furthermore the formulation is designed to be perfectly absorbable by corals.

• **Use:** shake the bottle well (6-8 times) before use. Pour 5 ml every 100 L of REEF CALCIUM water directly into the aquarium. Check the calcium value after 3-4 hours with the PRODAC TEST Ca. If necessary, add REEF CALCIUM and repeat the measurement until you have

obtained the desired concentration of calcium in your aquarium. Tip: In aquariums with many corals, we recommend a weekly check of the calcium value. In case of lack of calcium, add REEF CALCIUM until the desired value is reached.

**NEW
PRODUCT**

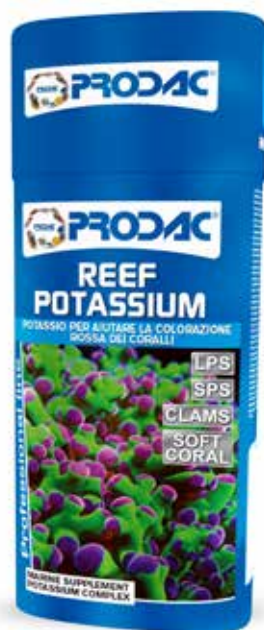

REEF MAGNESIUM

Concentrated solution of pure magnesium for reef aquariums and for all marine aquariums with invertebrates. Magnesium is one of the basic element for the formation of hard coral skeletons such as LPS and SPS. The addition of REEF MAGNESIUM helps to maintain the optimal magnesium value between 1100-1350 mg / l. A low concentration of magnesium makes difficult the absorption of the calcium in corals. Therefore, it is recommended to check the magnesium value before administering calcium.

• **Use:** shake the bottle well before use. Pour 5 ml every 100 L of REEF MAGNESIUM water directly into the aquarium, preferably in the water movement area and check after 3-4 hours if the magnesium value has been reached. The administration of 1 ml of product every 100 liters of water increases the magnesium value by 6 mg / L / ppm.

**NEW
PRODUCT**

REEF POTASSIUM

Concentrated pure potassium solution for reef aquariums and for all marine aquariums with invertebrates. Potassium is important for the neurological functions of corals and actively participates to carry the nutrients to soft corals. In corals SPS, it stimulates colouring. A low potassium concentration causes coral discoloration and polyps retraction. The ideal potassium value is between 370 - 420 mg / L.

Invertebrates need potassium for growth and coloration, therefore this value should be kept under control and increased when necessary with REEF POTASSIUM.

- **Use:** shake the bottle well before use. Pour 5 ml every 100 L of REEF POTASSIUM water directly into the aquarium, preferably in the water movement area, until the desired value is reached. The administration of 1 ml of product every 100 liters of water increases the potassium value by 1 mg / L / ppm.

**NEW
PRODUCT**

REEF STRONTIUM

Concentrated solution of pure strontium for the reef aquarium and for all marine aquariums with invertebrates. Strontium is used by hard corals for the formation of their skeleton, it promotes the synthesis of the calcareous substance helping the assimilation of calcium and favouring coloration. The ideal strontium value is between 8 - 8.3 mg / L. Invertebrates need strontium for growth, therefore it is advisable to keep this value controlled and increase it when necessary with REEF STRONTIUM.

- **Use:** shake the bottle well before use. Pour 5 ml per 100 L of REEF STRONTIUM water directly into the aquarium, on average once a week. Increase the frequency of administrations (every 4-5 days) in case of aquariums containing numerous invertebrates, verifying the value reached. The administration of 1 ml of product every 100 liters of water increases the strontium value by 1.5 mg / L / ppm.

MAGICTHERM 25-50-100-150-200-300

Heater ideal for both fresh and saltwater aquariums. The heater consists of a borosilicate glass tube which provides exceptional resistance to sudden temperature changes and to heat, guaranteeing against the risk of breakage or explosion in the event the heater still on is removed from the aquarium accidentally and then returned to the water. MAGICTHERM has a double sealing making it completely watertight and shatterproof. The heating element, manufactured using only high-quality materials and combined with this specific high-thermal conductive glass structure, ensures fast and efficient heating. The visible graduated scale for temperature control located on the cap of the heater allows for easy temperature adjustment offering also an optimal temperature range between 20 °C and 34 °C making this the ideal heater for all types of aquariums and fish.

ZEOLITH POND

Various minerals exist in Nature called zeolites. After extensive laboratory research, PRODAC have chosen ZEOLITH because of its high absorption power and its porosity, which gave the best results in helping the efficacious establishment of bacteria of the Nitrosomonas group.

- **Use:** using a sufficient layer of ZEOLITH in the pond filters has lead to the efficient absorption of nitrites, nitrate and ammonia, thus improving the biological balance of the pond. 5 kg pack sufficient to filter a pond of 7000 litres. We recommend changing it every 3 months.

PZEO5		5 Kg	1 PCS	8 018189 130298 

AQUASANA POND

Is an indispensable water conditioner which not only eliminates chlorine and chloramines in tap water, but also reduces the polluting effects caused by heavy metals in the water, conditioning and preparing the pond water for pond life and fish. It contains ALOE VERA a special and natural colloid which protects the skin slime and gills of fish reducing stress when changing water maintaining the pH level stable.

500 ml = 10.000 liters

+Aloe Vera

• **Use:** 100 ml per 2000 litres of water every 15 days. **WARNING:** when utilizing AQUASANA POND remove active carbon filters from the filtering system. It is highly recommended to keep the product out of reach of children.

ITEM CODE	SIZE	CARTON	BARCODE
PASAN500	500 ml 	6 PCS	 8 018189 130236

ALGACONTROL POND

Is a water treatment which controls, prevents and eliminates the growth, stimulated by sunlight, of floating algae in ponds. In fact floating algae is harmful to fish and aquatic plants. ALGACONTROL POND makes pond water crystal clear and maintains the pond in perfect conditions ensuring the safe growth and reproduction of fish and plants.

• **Use:** 100 ml per 2000 litres every 15 days. Dilute the required dosage in approximately 2 litres of water and evenly distribute the solution in the pond water; under normal conditions, good results are obtained after 24 to 36 hours. In the event of exceptional algae growth it is recommended to repeat treatment every 12 days. **WARNING:** in the event you should notice anomalous behaviour of the fish or the fish are visibly suffering immediately change 1/3 of the water.
